**Recommended general operator maintenance is listed below:**

### Daily

- **Clean the ‘rubber’ chamber seal (1) and stainless steel chamber face (2)** against which the rubber seal sits.
  - Use a clean soft lint free cloth (not paper) with mild detergent and warm water. Clean any debris and rinse well to remove any detergent residue. Dry the surfaces.

- Only if stubborn build-up is present on the chamber face, use a nylon scourer (eg. green Scotchbrite pad). Rinse well to remove any residue. Dry the surfaces.

### Weekly

- **Clean the chamber rack (5), inner chamber (3), door plate (4), and trays.**
  - Remove the trays and chamber rack from the chamber. Clean as above, rinse to remove any residue and dry all surfaces.

- **Clean the outer surfaces.**
  - Clean, rinse, removing any residue and dry.

- **Clean the mesh filter or replace if necessary.**
  - Open the door of the steriliser and remove the plastic filter cover plate (6) with your fingers. Using a large flat blade screwdriver, carefully remove the filter holder (7), then take the mesh filter (8) out of the holder (this is a tight fit).
  - Clean the mesh filter under running water. If necessary use a pointed tool to remove fluff and lint from **inside**. If necessary use a wire brush to remove build-up on the **outside**.
  - If the mesh filter cannot be cleaned acceptably, replace with a new one (2MOC-0043).
  - Replace the mesh filter in the filter holder and screw gently back into position. Add a little silicone lubricant to the o-ring if needed. Replace plastic filter cover plate.

### As Needed

- The chamber seal, bacterial filter and printer paper need to be replaced periodically—the frequency depends on usage. These items can be ordered from your local **Mocom** service provider.
